Planning as problem solving

- ▶ Planning:
 - ▶ Start state (S)
 - ▶ Goal state (G)
 - ▶ Set of actions
- ▶ Can be cast as “problem-solving” problem
- ▶ But, what if initial state is not known exactly? start in bottom row in 4x4 world, with goal being C.
- ▶ Do search over “sets” of underlying (atomic) states.

A	B	C	D
E			F
G			H
I	J	K	L

Actions: N.S.E.W

▶ 4

IF3054/NUMandKaelbling/19Apr10

Planning as Logic

- ▶ The problem solving formulation in terms of sets of atomic states is incredibly inefficient because of the exponential blowup in the number of sets of atomic states.
- ▶ Logic provides us with a way of describing sets of states.
- ▶ Can we formulate the planning problem using logical descriptions of the relevant sets of states?
- ▶ This is a classic approach to planning: situation calculus, use the mechanism of FOL to do planning.
- ▶ Describe states and actions in FOL and use theorem proving to find a plan.

▶ 5

IF3054/NUMandKaelbling/19Apr10

Situation Calculus

- ▶ Reify situations: [reify = name, treat them as objects] and use them as predicate arguments.
 - ▶ $\text{At}(\text{Robot}, \text{Room6}, S9)$ where $S9$ refers to a particular situation
- ▶ Result function: a function that describes the new situation resulting from taking an action in another situation.
 - ▶ $\text{Result}(\text{MoveNorth}, S1) = S6$
- ▶ Effect Axioms: what is the effect of taking an action in the world
 - ▶ For All x, s . $\text{Present}(x, s) \wedge \text{Portable}(x) \rightarrow \text{Holding}(x, \text{Result}(\text{Grab}, s))$
 - ▶ For All x, s . $\neg \text{Holding}(x, \text{Result}(\text{Drop}, s))$
- ▶ Frame Axioms: what doesn't change
 - ▶ For All x, s . $\text{color}(x, s) = \text{color}(x, \text{Result}(\text{Grab}, s))$
 - ▶ Can be included in Effect axioms

▶ 6

IF3054/NUMandKaelbling/19Apr10

Planning in Situation Calculus

- ▶ Use theorem proving to find a plan
- ▶ Goal state: $\text{For Some } s. \text{At}(\text{Home}, s) \wedge \text{Holding}(\text{Gold}, s)$
- ▶ Initial state: $\text{At}(\text{Home}, S_0) \wedge \neg \text{Holding}(\text{Gold}, S_0) \wedge \text{Holding}(\text{Rope}, S_0) \dots$
- ▶ Plan: $\text{Result}(\text{North}, \text{Result}(\text{Grab}, \text{Result}(\text{South}, S_0)))$
 - ▶ A situation that satisfies the requirements
 - ▶ First, move South, then Grab and then move North.

▶ 7

IF3054/NUMandKaelbling/19Apr10

Special Properties of Planning

- ▶ Reducing specific planning problem to general problem of theorem proving is not efficient.
- ▶ We will build a more specialized approach that exploits special properties of planning problems.
 - ▶ Connect action descriptions and state descriptions [focus searching]
 - ▶ Add actions to a plan in any order
 - ▶ Sub-problem independence
 - ▶ Restrict language for describing goals, states and actions

▶ 8

IF3054/NUMandKaelbling/19Apr10

STRIPS representations

- ▶ **States: conjunctions of ground literals**
 - ▶ $\text{In}(\text{robot}, r3) \wedge \text{Closed}(\text{door}6) \wedge \dots$
- ▶ **Goals: conjunctions of literals**
 - ▶ (implicit For Some r) $\text{In}(\text{Robot}, r) \wedge \text{In}(\text{Charger}, r)$
- ▶ **Actions (operators)**
 - ▶ Name (implicit For All): $\text{Go}(\text{here}, \text{there})$
 - ▶ Preconditions: conjunction of literals
 - ▶ $\text{At}(\text{here}) \wedge \text{path}(\text{here}, \text{there})$
 - ▶ Effects: conjunctions of literals [also known as post-conditions, add-list, delete-list]
 - ▶ $\text{At}(\text{there}) \wedge \neg \text{At}(\text{here})$
 - ▶ Assumes no inference in relating predicates (only equality)

▶ 9

IF3054/NUMandKaelbling/19Apr10

Strips Example

- ▶ **Action**
 - ▶ $\text{Buy}(x, \text{store})$
 - ▶ Pre: $\text{At}(\text{store}), \text{Sells}(\text{store}, x)$
 - ▶ Eff: $\text{Have}(x)$
 - ▶ $\text{Go}(x, y)$
 - ▶ Pre: $\text{At}(x)$
 - ▶ Eff: $\text{At}(y), \neg \text{At}(x)$
- ▶ **Goal**
 - ▶ $\text{Have}(\text{Milk}) \wedge \text{Have}(\text{Banana}) \wedge \text{Have}(\text{Drill})$
- ▶ **Start**
 - ▶ $\text{At}(\text{Home}) \wedge \text{Sells}(\text{SM}, \text{Milk}) \wedge \text{Sells}(\text{SM}, \text{Banana}) \wedge \text{Sells}(\text{HW}, \text{Drill})$

▶ 10

IF3054/NUMandKaelbling/19Apr10

Planning Algorithms

- ▶ Progression planners: consider the effect of all possible actions in a given state.

- ▶ Regression planners: to achieve a goal, what must have been true in previous state.

$\text{Have}(M) \wedge \text{Have}(B) \wedge \text{Have}(D)$

$\text{Buy}(M, \text{store})$

$\text{At}(\text{store}) \wedge \text{Sells}(\text{store}, M) \wedge \text{Have}(B) \wedge \text{Have}(D)$

- Both have problem of lack of direction – what action or goal to pursue next.

▶ 11

IF3054/NUMandKaelbling/19Apr10

Plan – Space Search

- ▶ Situation space – both progressive and regressive planners plan in space of situations
- ▶ Plan space – start with null plan and add steps to plan until it achieves the goal
 - ▶ Decouples planning order from execution order
 - ▶ Least-commitment
 - ▶ First think of what actions before thinking about what order to do the actions
 - ▶ Means-ends analysis
 - ▶ Try to match the available means to the current ends

▶ 12

IF3054/NUMandKaelbling/19Apr10

Partially Ordered Plan (POP)

- ▶ Set of steps (instance of an operator)
- ▶ Set of ordering constraints $S_i < S_j$
- ▶ Set of variable binding constraints $v=x$
 - ▶ v is a variable in a step; x is a constant or another variable
- ▶ Set of causal links $S_i \text{ c } S_j$
 - ▶ Step i achieves precondition c for step j

▶ 13

IF3054/NUMandKaelbling/19Apr10

Initial Plan

- ▶ Steps: {start, finish}
- ▶ Ordering: {start < finish}
- ▶ start
 - ▶ Pre: none
 - ▶ Effects: start conditions
- ▶ finish
 - ▶ Pre: goal conditions
 - ▶ Effects: none

▶ 14

IF3054/NUMandKaelbling/19Apr10

Plan Completeness

- ▶ A plan is complete iff every precondition of every step is achieved by some other step.
- ▶ $S_i \rightarrow_c S_j$ ("step i achieves c for step j ") iff
 - ▶ $S_i < S_j$
 - ▶ $c \in \text{effects}(S_i)$
 - ▶ $\neg \exists S_k. \neg c \in \text{effects}(S_k) \text{ and } S_i < S_k < S_j$ is consistent with the ordering constraints
- ▶ A plan is consistent iff the ordering constraints are consistent and the variable binding constraints are consistent.

▶ 15

IF3054/NUMandKaelbling/19Apr10

Partial Order Planning Algorithms

- ▶ Plan
 - ▶ Steps
 - ▶ Ordering Constraints
 - ▶ Variable binding constraints
 - ▶ Causal links
- ▶ POP Algorithm
 - ▶ Make Initial Plan
 - ▶ Loop until plan is a complete plan
 - ▶ Select a subgoal
 - ▶ Choose an operator
 - ▶ Resolve threats

Resolve Threats

- step S threatens a causal link $S_i \rightarrow^c S_j$ iff $\neg c \in \text{effects}(S)$ and it's possible that $S_i < S < S_j$
- For each threat
 - Choose
 - Promote $S : S < S_i < S_j$
 - Demote $S : S_i < S_j < S$
 - If resulting plan is inconsistent, then Fail
