

## IF2261 Software Engineering

### Software Process

Program Studi Teknik Informatika  
STEI ITB

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 1

## Software Process

- The roadmap to building high quality software products
- Adapted to meet the needs of software engineers and managers
- Provides a framework for managing activities
- Different types of projects require different software processes
- Work products are produced by the software process
- The best indicators of how well a software process has worked are the quality, timeliness, and long-term viability of the resulting software product

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 2

## Common Process Framework

- Communication
  - customer collaboration and requirement gathering
- Planning
  - establishes engineering work plan, describes technical risks, lists resource requirements, work products produced, and defines work schedule
- Modeling
  - creation of models to help developers and customers understand the requires and software design
- Construction
  - code generation and testing
- Deployment
  - software delivered for customer evaluation and feedback

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 3

## SE Umbrella Activities

- Software project tracking and control
- Risk management
- Software quality assurance
- Formal technical reviews
- Measurement
- Software configuration management
- Reusability management
- Work product preparation and production

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

IF2261 Introduction

Page 5

## SEI – CMMI

[www.sei.cmu.edu/cmmi](http://www.sei.cmu.edu/cmmi)

- Level 0: Incomplete
  - process is not performed or does not achieve all goals defined for level 1
- Level 1: Performed
  - work tasks required to produce required work products are being conducted
- Level 2: Managed
  - people doing work have access to adequate resources to get job done, stakeholders are actively involved, work tasks and products are monitored, reviewed, and evaluated for conformance to process description
- Level 3: Defined
  - management and engineering processes documented, standardized, and integrated into organization-wide software process
- Level 4: Quantitatively Managed
  - software process and products are quantitatively understood and controlled using detailed measures
- Level 5: Optimizing
  - continuous process improvement is enabled by quantitative feedback from the process and testing innovative ideas

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

### ● Why "India Inside" Spells Quality

Did you know that 75% of the world's CMM Level 5 software centers were in India? Here's how the quality movement transformed the Indian IT services industry

Monday, October 27, 2003

Europe, and the need for ISO certification, provided the trigger to the quality movement in India. But the real impetus came after Motorola's software center at Bangalore became the world's second CMM Level 5 unit in 1994 (the first was at NASA)

- Even for those familiar with India's software industry, this is a startling number.
- There are 80 software centers on the planet that are assessed at CMM Level 5. Of all those centers, 60 are in India.

IF-ITB/YW/Revisi: Februari 2008  
IE2261 Introduction

Page 11

## Process Assessment

- Assessment is attempts to understand the current state of the software process with the intend of improving it
- SPICE (ISO/IE15504) defines a set of requirements for process assessment
  - Examines the processes used by organizations to determine whether they are effective in achieving their goals
  - Provides a reference model that examines the purpose and measurable objectives of the process (process dimension) and the set of process attributes that should be present (capability dimension)
  - SPICE model assessment is a structured evaluation of a process model (activities, tasks, work products, etc.)
- ISO 9001:2000 for Software defines requirements for a quality management system that will produce higher quality products and improve customer satisfaction
  - Stresses the importance for an organization to identify, implement, manage, and continually improve the effectiveness processes needed for a quality management system and to manage process interactions to achieve organization objectives
  - Process effectiveness and efficiency are assessed through internal or external review of processes using maturity scales
  - Results can be documented and monitored over time to reach improvement goals using "plan-do-check-act" cycle

IF-ITB/YW/Revisi: Februari 2008  
IE2261 Introduction

Page 12

## Process Model

- Prescriptive Models
  - The Waterfall Model
  - Incremental Models
  - Evolutionary Process Models
- Specialized Process Models
- The Unified Process

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 13

## Prescriptive Models

- Originally proposed to bring order to the chaos of software development
- Called "prescriptive" because:
  - prescribe a set of process elements (activities, actions, tasks, work products, quality assurance etc for each project)
  - each process model also prescribes a workflow
- They brought order to software engineering work and provide reasonable guidance to software teams
- Yet, they have not provided a definitive answer to the problems of software development in an ever changing computing environment

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 14

## The Waterfall Model

- Waterfall Model
  - old fashioned but reasonable approach when requirements are well understood

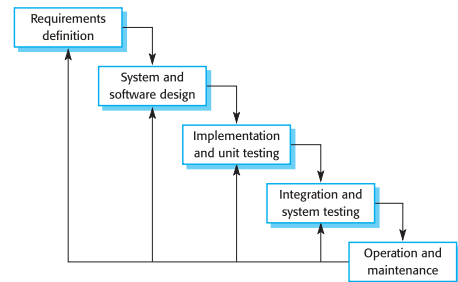

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 15

## The Waterfall Model

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 16

## The Waterfall Model Problem

- Inflexible partitioning of the project into distinct stages makes it difficult to respond to changing customer requirements.
- Therefore, this model is only appropriate when the requirements are well-understood and changes will be fairly limited during the design process.
- Few business systems have stable requirements.
- The waterfall model is mostly used for large systems engineering projects where a system is developed at several sites.

\* Software Engineering 7<sup>th</sup> ed, Ian Sommerville

IF2261 Introduction

Page 17

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 18

## Incremental Models

### Incremental Model

- delivers software in small but usable pieces, each piece builds on pieces already delivered

### Rapid Application and Development (RAD) Model

- makes heavy use of reusable software components with an extremely short development cycle

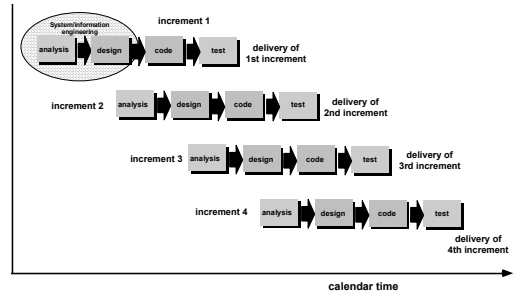

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IE2261 Introduction

Page 19

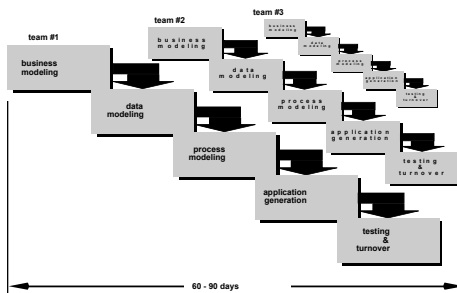

## Incremental Model

IF-ITB/YW/Revisi: Februari 2008  
IE2261 Introduction

Page 20

## RAD Model

IF-ITB/YW/Revisi: Februari 2008  
IE2261 Introduction

Page 21

## Evolutionary Process Models

### Prototyping Model

- good first step when customer has a legitimate need, but is clueless about the details, developer needs to resist pressure to extend a rough prototype into a production product

### Spiral Model

- couples iterative nature of prototyping with the controlled and systematic aspects of the linear sequential model

### Concurrent Development Model

- similar to spiral model often used in development of client/server applications

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IE2261 Introduction

Page 27

## Specialized Process Models

- Component-Based Development
  - spiral model variation in which applications are built from prepackaged software components called classes
- Formal Methods Model
  - rigorous mathematical notation used to specify, design, and verify computer-based systems
- Aspect-Oriented Programming
  - provides a process for defining, specifying, designing, and constructing software aspects like user interfaces, security, and memory management that impact many parts of the system being developed

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IE2261 Introduction

Page 28

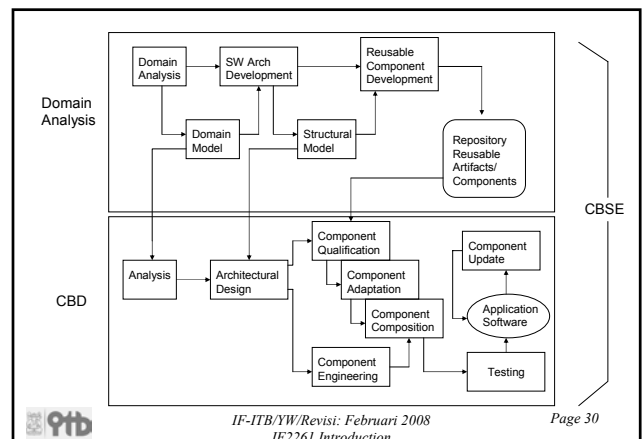

## CBSE

- Based on systematic reuse where systems are integrated from existing components or COTS (Commercial-off-the-shelf) systems.
- Process stages
  - Component analysis;
  - Requirements modification;
  - System design with reuse;
  - Development and integration.
- This approach is becoming increasingly used as component standards have emerged.

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IE2261 Introduction

Page 30

## The Unified Process

- Use-case driven, architecture centric, iterative, and incremental software process
- Attempts to draw on best features of traditional software process models and implements many features of agile software development
- Phases
  - Inception phase (customer communication and planning)
  - Elaboration phase (communication and modeling)
  - Construction phase
  - Transition phase (customer delivery and feedback)
  - Production phase (software monitoring and support)

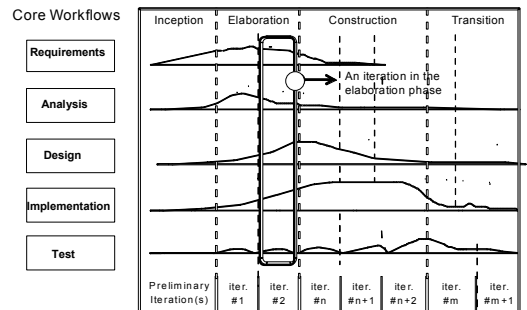

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 31

## Iteration and Workflow Phases

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 32

## Unified Process Work Products

- Inception phase
  - Vision document
  - Initial use-case model
  - Initial project glossary
  - Initial business case
  - Initial risk assessment
  - Project plan (phases and iterations)
  - Business model
  - Prototypes
- Elaboration phase
  - Use-case model
  - Functional and non-functional requirements
  - Analysis model
  - Software architecture description
  - Executable architectural prototype
  - Preliminary design model
  - Revise risk list
  - Project plan (iteration plan, workflow, milestones)
  - Preliminary user manual
- Construction phase
  - Design model
  - Software components
  - Integrated software increment
  - Test plan
  - Test cases
  - Support documentation (user, installation, increment)
- Transition phase
  - Delivered software increment
  - Beta test reports
  - User feedback

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 33

## An Agile View of Process

- Represents a reasonable compromise between conventional software engineering for certain classes of software and certain types of software projects
- Can deliver successful systems quickly
- Stresses continuous communication and collaboration among developers and customers
- Embraces a philosophy that encourages:
  - customer satisfaction,
  - incremental software delivery,
  - small project teams (composed of software engineers and stakeholders),
  - informal methods, and
  - minimal software engineering work products
- Stress on-time delivery of an operational software increment over analysis and design

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman

IF-ITB/YW/Revisi: Februari 2008  
IF2261 Introduction

Page 34

## Manifesto for Agile Software Development

- Proposes that it may be better to value:
  - Individuals and interactions over processes and tools
  - Working software over comprehensive documentation
  - Customer collaboration over contract negotiation
  - Responding to change over following a plan
- While the items on the right are still important the items on the left are more valuable under this philosophy
- Note: although most practitioners agree with this philosophy in theory, many pragmatic issues surface in the real world that may cause items on the right to be as important as items on the left

\* SEPA 6<sup>th</sup> ed, Roger S. Pressman
